

Glossary: Introduction to Web Development with HTML, CSS, JavaScript

Welcome! This alphabetized glossary contains many of the terms in this course. This comprehensive glossary also includes additional industry-recognized terms not used in course videos. These terms are essential for you to recognize when working in the industry, participating in user groups, and in other professional certificate programs.

Estimated reading time: 10 minutes

[illegible]

Term	Definition
	<pre> { //code alert("A") } </script> </button> </pre> Note that <code>showAnswers()</code> is an event handler.
Event	An event is something either a browser or a user does that the JavaScript can react to such as a button click or when a user submits input on a form.
Extend	This keyword is used in class declarations or class expressions to create a class that is a child of another class.
Fixed Layout	A fixed layout is a layout where you specify the height and width of elements, and those values remain the same regardless of which operating system or browser you use to access the website.
Fluid Layout	A fluid layout is a layout in which the height and width of elements is flexible and can expand or contract based on the browser window, the operating system, and other user preferences.
Frameworks	Provide a standard way to build an application. Frameworks dictate architecture and program flow.
Functions	Functions are modules of code that execute a particular task. They may take-in data, called arguments or parameters, and sometimes return data as well, called the return value. Functions are commonly defined with this syntax: <pre> function functionName() { // function code; // optional return statement; } </pre>
IDE	"Integrated Development Environment" helps create and manage code.
IIFE	"Immediately Invoked Function Expression" runs immediately after it is defined. After the function executes it cannot be called again elsewhere in the program. It is a type of self-executing function.
Inversion of Control	A predefined workflow where the developer is not in full control of how the application operates.
JavaScript Framework	An application framework written in JavaScript to create responsive sites.
LESS	"Learner Style Sheets" add more style and functions to CSS.
less.js	A JavaScript tool that converts LESS styles to CSS.
Libraries	They are reusable collections of code.
Nodes	The basis of all elements in the Document Object Model (DOM) structure.
Objects	Objects are instances created from a class. They are real-world entities that represent the characteristics defined by the class. Objects have a special set of properties that store data and methods that specify behaviours. These methods and properties can be accessed and changed to carry out specific tasks and communicate with other programs.
Opinionated	Frameworks that have a lot of control are sometimes considered "opinionated".
Package Managers	Coordinate with file archivers to extract packages. Verify check sums and digital certificates. Locate, download, and install updates of existing software from a repository as well as manage dependencies. Common package managers include the following: Debian Package Management System (DPMS), Red Hat Package Manager for Linux, Chocolatey for Windows, Homebrew and MacPorts for MacOS.
Packages	Archive files that include app files, instructions for installation, and metadata.
Prototypes	A function prototype lets you easily define and add properties or methods to an object. Prototypes exist for all objects that can be created with the keyword "new". All object constructors create objects that inherit properties and methods that are defined by the prototype. At instantiation objects inherit the current state of the prototype. Note however, that scripts can override prototype properties and functions. Following is an example of using a prototype to add a method to the Car class: <pre> function Car(make, model, year) { this.make = make; this.model = model; this.year = year; } Car.prototype.getName = function() { </pre>

Term	Definition
	<pre> return this.make + ' ' + this.model + ' ' + this.year; } </pre>
React.js	A JavaScript framework developed by Facebook that helps build and drop elements onto a page.
Responsive Design	Design technique that automatically resizes a display to adapt to a specific screen size.
Route	Allows front-end client to plug into correct socket on the backend. They are the paths that network traffic takes from a virtual machine (VM) instance to other destinations.
SASS	"Syntactically Awesome Stylesheets" are an extension of CSS.
Script	Offers developers means to modify and extend HTML documents in highly interactive ways. Scripts can be used to validate forms or to process input as it is typed. Scripts can be triggered by events that occur on a web page, such as the clicking of a button. Scripts can be used to dynamically create document elements on an HTML page.
Self-Executing Functions	Often used to initialize data or declare DOM elements. These functions can be anonymous.
Static Content	A display of data that has been previously stored on a server.
Text Nodes	The nodes that contain actual text that go between an element start tag and end tag.
this	Keyword "this" refers to current instance of the object. The value of "this" can vary depending on how the object is called.
Utility Framework	The utility framework provides utility classes that are scoped to individual CSS properties, which helps in building custom designs in HTML files.
Version Control	Allows you to revert to earlier versions of code, resolves conflicts between the same files, and split and merge different code branches.
Vue.js	A community-based JavaScript framework focused on UI. Includes UI components such as buttons and other visual elements, and is both a library and a frame.
Web Storage APIs	APIs that allow data storage in a browser.
XHTML	An "eXtensible Hypertext Markup Language" similar to HTML but with stricter formatting rules.
XML	An "eXtensible Markup Language" Designed to store and transport data allowing users to define their own markup languages, primarily to display documents on the web.
